Question 1 EM for Probabilistic PCA

(a) E-step. Calculate the statistics of the posterior distribution q(z) = p(z|x) which you'll need for the M-step.

From the Appendix, we know how to get the distribution of z given x, where z is drawn from Gaussian distribution and x is drawn from a spherical Gaussian distribution. In our setting,

$$p(z) = \mathcal{N}(z|0,1)$$
$$p(\mathbf{x}|z) = \mathcal{N}(\mathbf{x}|z\mathbf{u}, \sigma^2\mathbf{I})$$

To apply the parameters in the formulae of the Appendix, we have

$$\mu = 0, \Sigma = 1,$$
 $A = u, B = 0, S = \sigma^2 I$

$$C = (1 + u^T (\sigma^2)^{-1} u)^{-1} = \frac{\sigma^2}{\sigma^2 + u^T u}$$

Thus, we can obtain the following formulae:

$$p(x) = \mathcal{N}(x|0, u^T u + \sigma^2)$$

$$p(z|x) = \mathcal{N}(z|C(u^T(\sigma^2)^{-1}x), C)$$

$$= \mathcal{N}(z|\frac{u^T x}{\sigma^2 + u^T u}, \frac{\sigma^2}{\sigma^2 + u^T u})$$

As a result,

$$m = E[z|\mathbf{x}] = \frac{\mathbf{u}^T \mathbf{x}}{\sigma^2 + \mathbf{u}^T \mathbf{u}}$$

$$Var[z|\mathbf{x}] = \frac{\sigma^2}{\sigma^2 + \mathbf{u}^T \mathbf{u}}$$

$$s = E[z^2|\mathbf{x}] = Var[z|\mathbf{x}] + E[z|\mathbf{x}]^2$$

$$= \frac{\sigma^4 + \sigma^2 \mathbf{u}^T \mathbf{u} + (\mathbf{u}^T \mathbf{x})^2}{(\sigma^2 + \mathbf{u}^T \mathbf{u})^2}$$

(b) M-step. Re-estimate the parameters, which consist of the vector \mathbf{u} . derive a formula for \mathbf{u}_{new} that maximizes the expected log-likelihood, i.e.,

$$\boldsymbol{u}_{new} = \arg\max_{\boldsymbol{u}} \frac{1}{N} \sum_{i=1}^{N} \mathbb{E}_{q(\boldsymbol{z}^{(i)})}[\log p(\boldsymbol{z}^{(i)}, \boldsymbol{x}^{(i)})]$$

Denote the function to be maximized as

$$\begin{split} \mathbb{F} &= \frac{1}{N} \sum_{i=1}^{N} \mathbb{E}_{q(z^{(i)})}[\log p(z^{(i)}, \boldsymbol{x}^{(i)})] \\ &= \frac{1}{N} \sum_{i=1}^{N} \mathbb{E}_{q(z^{(i)})}[\log q(z^{(i)}) p(\boldsymbol{x}^{(i)})] \end{split}$$

Then,

$$\begin{split} \log p(\boldsymbol{x}^{(i)})q(z^{(i)}) &= \log \frac{1}{\sqrt{2\pi(\boldsymbol{u}^T\boldsymbol{u} + \sigma^2)}} e^{-\frac{\boldsymbol{x}^{(i)2}}{2(\boldsymbol{u}^T\boldsymbol{u} + \sigma^2)}} \frac{1}{\sqrt{2\pi\frac{\sigma^2}{\boldsymbol{u}^T\boldsymbol{u} + \sigma^2}}} e^{-\frac{(z^{(i)} - \frac{\boldsymbol{u}^T\boldsymbol{x}^{(i)}}{\sigma^2 + \boldsymbol{u}^T\boldsymbol{u}})^2}{2\frac{\sigma^2}{\boldsymbol{u}^T\boldsymbol{u} + \sigma^2}}} \\ &\propto -\frac{\boldsymbol{x}^{(i)2}}{2(\boldsymbol{u}^T\boldsymbol{u} + \sigma^2)} - \frac{(z^{(i)} - \frac{\boldsymbol{u}^T\boldsymbol{x}^{(i)}}{\sigma^2 + \boldsymbol{u}^T\boldsymbol{u}})^2}{2\frac{\sigma^2}{\boldsymbol{u}^T\boldsymbol{u} + \sigma^2}} \\ &\propto -\frac{\boldsymbol{x}^{(i)2}\sigma^2 + [\boldsymbol{u}^T\boldsymbol{x}^{(i)} - (\sigma^2 + \boldsymbol{u}^T\boldsymbol{u})z^{(i)}]^2}{2\sigma^2(\boldsymbol{u}^T\boldsymbol{u} + \sigma^2)} \\ &\propto -\frac{z^{(i)2}(\sigma^2 + \boldsymbol{u}^T\boldsymbol{u})}{2\sigma^2} + \frac{z^{(i)}\boldsymbol{u}^T\boldsymbol{x}^{(i)}}{\sigma^2} \\ &\propto -\frac{z^{(i)2}\boldsymbol{u}^T\boldsymbol{u}}{2\sigma^2} + \frac{z^{(i)}\boldsymbol{u}^T\boldsymbol{x}^{(i)}}{\sigma^2} \end{split}$$

Apply the liearity of expectation,

$$\begin{split} \mathbb{F} &= \frac{1}{N} \sum_{i=1}^{N} \mathbb{E}[\log p(\boldsymbol{x}^{(i)}) q(z^{(i)})] \\ &= \frac{1}{N} \sum_{i=1}^{N} [-\frac{\mathbb{E}[z^{(i)2} | \boldsymbol{x}^{(i)}] \boldsymbol{u}^T \boldsymbol{u}}{2\sigma^2} + \frac{\mathbb{E}[z^{(i)} | \boldsymbol{x}^{(i)}] \boldsymbol{u}^T \boldsymbol{x}^{(i)}}{\sigma^2}] \\ &= \frac{1}{N} \sum_{i=1}^{N} [-\frac{m^{(i)} \boldsymbol{u}^T \boldsymbol{u}}{2\sigma^2} + \frac{s^{(i)} \boldsymbol{u}^T \boldsymbol{x}^{(i)}}{\sigma^2}] \end{split}$$

To get the gradient with repect to u_i

$$\begin{split} \frac{\partial \mathbb{F}}{\partial \boldsymbol{u}} &= -\frac{1}{N} \sum_{i=1}^{N} [\frac{\boldsymbol{m}^{(i)} \boldsymbol{u}}{\sigma^2} + \frac{\boldsymbol{s}^{(i)} \boldsymbol{x}^{(i)} \boldsymbol{I}}{\sigma^2}] = 0 \\ \boldsymbol{u} &\leftarrow \frac{\frac{1}{N} \sum_{i=1}^{N} \boldsymbol{s}^{(i)} \boldsymbol{x}^{(i)} \boldsymbol{I}}{\frac{1}{N} \sum_{i=1}^{N} \boldsymbol{m}^{(i)}} \\ \boldsymbol{u} &\leftarrow \frac{\sum_{i=1}^{N} \boldsymbol{s}^{(i)} \boldsymbol{x}^{(i)} \boldsymbol{I}}{\sum_{i=1}^{N} \boldsymbol{m}^{(i)}} \end{split}$$

Question 2 Contraction Maps
